

Studify – learn how people learn

We want to collect information on how people learn. To do that, we propose to create a app that gatters links, documents and datasets intend to use for teaching online. Then the app will record information on how people interact with that content, from mouse movement to time spend watching a video. The more people will use Studify, better data will be generated and keep open to the public, helping researchers and teachers to learn more about how effective different types of classes and materials are.
